

Form Actions Overview

Last Modified on 07/28/2022 4:55 pm EDT

The **Actions** element allows end-users to open a specified form or data visualization (including [Data Analytics Export reports](#)) by clicking a button on a standard form.

This element type is useful when the user needs to complete or print related forms throughout a process, they would benefit from being able to view report data while working in an object, or they need a summary of object data for further analysis.

Form actions include:

- **Open a form:** Opens a standard form related to the object type.
- **Open a data visualization:** Opens a [report](#) or [data grid](#) related to the object type.
- **Export Data:** Opens a [report](#) that allows users to export object data from the form's object type.
- **Open Assessment Scoping:** Opens a [navigation form](#) that allows users to view, filter, and add focus objects to an assessment.
- **Open Assessment Rescoping:** Opens a [navigation form](#) that allows users to add additional objects to a previously launched assessment.

Because each form action requires data from the originating object, actions should only be added to forms for **existing** objects. Clicking an action button on a form still in the **Creation** state will display blank, read-only forms or reports with no data. If the **Open Assessment Scoping** action is added to a standard form for a new assessment, it will not be displayed until the assessment has been created.
