

Object Properties

Last Modified on 01/28/2021 1:57 pm EST

Properties are auto-created components that display an object's default information. Properties can be displayed on a [configurable form](#) or in an [email template](#). They include:

- **Name:** The title of the object, which helps identify the object in [views](#) or [search](#) results. The header of this property appears on forms as [Object Type] Name (e.g. Incident Name).

The **Name** property should be included on all your standard forms as it's used to identify objects in search results, views, data visualizations, relationships, etc. If this property is not added to your forms, users will not be able to search for and select existing objects in relationship fields or tables.

- **Description:** A description of the object.
- **Unique ID:** The unique identifier automatically assigned to the object type at the time of creation.
- **Monogram:** The letter(s) and color assigned to the object type.
- **Created By:** The user who created the object.
- **Created On:** The date the object was created, converted to the current user's time zone.
- **Modified By:** The name of the user who last modified the object.
- **Modified On:** The date the object was last modified, converted to the current user's time zone.
- **Workflow State:** The current state of the object.
- **Location:** The address and/or latitude and longitude coordinates of an object. See the [Locations](#) section for more information.
- **Assessment Dimension:** Adds read-only [dimension](#) data onto the form of objects that were referenced on an assessment. If an object has not been referenced on an assessment, the property will be invisible.
